

We're on the brink of ...

- some next digital revolution ;=;

three major shifts in AI:

huge context windows, ...

- where would you store your digital friend? (Essentially this context window is your image/ projection/ copy of the LLM)
- they'll be stored as digital people within facebooks, twitters and even tik toks

agent-based learning, ...

- they will be paid services. free tiers included though
- agents will be learning, improving. like your video game NPCs but with lasting interactions spanning multiple applications
- business will be affected

and text-to-action capabilities. ...

- the grey area of legislation is where the bots roam - (Marcus Barki Aurelius)

— tech jargon para - omitted—

Meanwhile, agents are emerging as LLMs that can learn by reading, testing, and reconfiguring their own understanding.

- self proclaimed generation jump. It's still a calculator that understands [a-Z] in addition to the usual [0-9]

Finally, text-to-action is where you'll be able to say, "Build me the next (USA)," and the AI will code, iterate, and deploy it, instantly at scale.

— lost me at three —

now the pitch

Imagine everyone having a personal programmer: not just for silly projects, but for real innovation or disruptive tools.

Right now, these systems are limited by cost and complexity, but those barriers won't last.

The moment they come down, you'll see a wave of new creations roll out in mere hours or days, things no single developer or team could've spun up alone.

and the three guiding buzz words/ keywords/ hype train compartments

That's the power of

1. big context,
2. self-learning agents, and
3. instant action,

And I can't wait to see all merging in the very near future.

closing on lies, as always
